

Welcome to Managing Digital Content Over Time. This training was produced by the State Electronic Records Initiative, in coordination with the Council of State Archivists. It was developed under a grant from the Institute of Museum and Library Services and based primarily on training created by the Library of Congress. It is to help archives and others who maintain electronic records understand the necessary steps of digital preservation. This is module 1, Identify.

Public records

- Public records
 - Data or information in a **fixed format** that was **created or received by a government agency** in the **course of business** and that is **preserved** for future reference
 - **Legal definitions vary** from state to state
- Electronic records
 - Data or information fixed and stored in **automated system**
 - Can be **accessed only via system**

Before we begin, let's take a moment to examine the differences between "public records," "electronic records" and "digital content." Archivists and records managers who work in state government archives are typically focused upon and work with public records, which the Society of American Archivists' *Glossary of Archival and Records Terminology* defines as: "data or information in a fixed format that was created or received by a government agency in the course of business and that is preserved for future reference." The precise legal definition of what constitutes a public record or government record varies from state to state, but virtually all public records laws focus on information that documents government business activities.

Within the government environment, electronic records are public records that have "been captured and fixed for storage and manipulation in an automated system and that requires the use of the system to render it intelligible." [SAA *Glossary*, s.v. "electronic record"]

However, some state archives acquire not only state government records but also the papers of individuals and the records of non-governmental organizations. Other archivists and records managers work exclusively with non-government materials. As a result, in these training modules we're going to use "digital content," a much broader term.

What is Digital Content?

- **Digital content** is any content that is published or distributed in a digital form, including text, images, sound recordings, video, data sets, and software.
- Digital materials created from analog sources
- Born-digital content

SERI
State Electronic
Records Initiative

LIBRARY OF CONGRESS

**INSTITUTE of
Museum and Library
SERVICES**

What is digital content? Digital content is any content that is published or distributed in a digital form, including text, images, sound recordings, video, data sets, and software.

Anything we may encounter in a digital form is going to fall under the umbrella of digital content. This is going to encompass anything that comes our way and that we are going to have to think about preserving for a long period of time.

There are really two sources of this digital material –

- Those created from physical sources that we turn into digital items, such as digitization of maps or documents
- Those that are created digitally, such as items on our computers or digital photos

A lot of times our responsibilities include not only holding and preserving that digital content, but also making it available to the public. But this ever-increasing digital world is presenting us with new challenges. And what are those problems? ...

What's the Problem?

- We are creating increasing amounts of digital content (or it's arriving at our doorstep)
- Digital assets arrive in all file formats and on all media
- The longer we wait, the greater the chance that something will be unreadable

SERI
State Electronic
Records Initiative

LIBRARY OF CONGRESS

INSTITUTE of Museum and Library SERVICES

Everyone is

creating digital content in lots of different formats

distributing digital content

using digital content

And **we are responsible** for managing digital content now or are expected to in the near future.
The longer we wait, the greater the chance that something will be unreadable.

What could possibly go wrong?

Digital Preservation – A Definition

Digital preservation **combines policies, strategies and actions to ensure access** to reformatted and born digital content regardless of the challenges of media failure and technological change. The goal of digital preservation is the **accurate rendering of authenticated content over time.**

Working group on Defining Digital Preservation, ALA Annual Conference, 2007

LIBRARY OF CONGRESS

SERI

Part of the curriculum in this program was developed by the Library of Congress as part of their Digital Preservation Outreach and Education program. DPOE is part of a national effort

The first 4-day National DPOE Train-the-Trainer workshop was held at the Library of Congress in Sept 2011.

The next six slides use an extended visual metaphor to explain the six modules for this training.

To look at the process metaphorically, the slides describe these steps in terms of getting oranges from the processing plant to market where people can access them.

The orange processing closely mirrors actions that you take with digital content.

Here the worker is grading the oranges, identifying their quality and variety.

Select - what portion of that content will be preserved?

A photograph showing a man in a blue shirt and cap selecting oranges from a large pile of oranges arranged in rows on a wooden surface. The oranges are bright yellow and the man is focused on his task.

LIBRARY OF CONGRESS

SERI
State Electronic
Records Initiative

INSTITUTE of
Museum and Library
SERVICES

Here a man is selecting one orange out of many.

The selection process requires that one choose only a small percentage of your content for full long-term storage to keep management costs in control.

A man is bringing oranges into refrigerated storage.

How are you going to store the oranges – sometimes for a fair amount of time – so that they make it to the public in the same state you packaged them?

Protect - what steps are needed to protect your digital content?

The image shows a woman in a grey shirt and green apron packing oranges into a white box labeled 'Sunkist Oranges'. The box is on a conveyor belt, and there are many oranges around her. The image is framed within a larger slide that has a light blue and yellow background with curved lines.

LIBRARY OF CONGRESS

SERI
State Electronic
Records Initiative

INSTITUTE of
Museum and Library
SERVICES

A woman is packing oranges to protect them from damage during transit.

Aside from storage conditions, how are you going to protect them from any damage that may occur?

A man is stacking and organizing content in storage in a pattern to fit the most in the truck. Here you see all the elements that need to be supported for orange storage: labor, equipment, space, packaging, and of course basic organizational skills to get it to all work together.

Note: Admittedly, this is the most tenuous part of the metaphor, as management is so abstract.

Provide - what considerations are there for long-term access?

Oranges for sale at a store, the ultimate goal of the process.

Modules are not designed to necessarily provide specific technological solutions but they are designed to make sure the right questions are being asked about each stage – planning, policies, staffing, and advocacy.

Identify and Select are in the center – they repeat over time and often happen at the same time. It is here that we identify new/additional content and then select the portion to preserve.

Store the selected content.

Protect what is stored.

Manage it over time (preserve it) – including policies/rules for identifying, selecting, storing, protecting and providing content. Providing preserved content over time (long-term access) relies upon good management over time

Why identify?

1. Preservation requires an **explicit, ongoing commitment** of resources
2. **Effective planning** is based on knowing the extent of what will be preserved
3. **Identifying** content is a first step in planning for current and future preservation needs
4. **Not all** digital content in and around an organization **will (can, should) be preserved**

SERI
State Electronic
Records Initiative

LIBRARY OF CONGRESS

INSTITUTE of Museum and Library SERVICES

So let's get started...

As stated earlier, the volume and kinds of digital materials we create or inherit are growing.

Much of it is useful and even necessary for our work, but much of it is not. Think of the string of e-mails created as people go back and forth discussing a topic. Or different drafts of a document. How much of that is really worth saving for posterity? The Identify stage helps us figure out what content we have, so we can determine what needs to be kept.

Good digital preservation requires an explicit commitment of resources in terms of staffing, finances and cooperation from others, which - for most organizations - means planning ahead. If you don't know the extent of the problem, you don't know what resources you need.

The first step in planning for digital preservation is to know where you stand with regard to your digital assets.

Identifying content is a foundational step for digital preservation. It helps determine the extent of what you may need to preserve.

The orange section is what the inventory will cover, so it's the first step in whittling down the vast amount of data that an organization creates.

The inventory process is also a powerful way to raise awareness of the problem within your institution.

First Steps

- Identifying content is the first step to planning for current and future preservation needs
- Ask: what content
 - do* I have,
 - will* I have,
 - might* I have,
 - must* I have?

In order to plan effectively for the future, you need more specific answers to several questions:

- What content do you have now? (this includes the files you are actively managing, as well as the stuff that's hiding on someone's hard drive)
- What content do you know you will have in the future? (digitization project that is regularly producing image or audio files)
- What content might you end up having? (potential large donations; content stored with a 3rd party – what happens if they go out of business, or you can't pay the required fees)
- What content must you have? (for a State Archives – if we know that an agency has gone mostly paperless, we should be receiving electronic records to document the activities of that agency. We may have legal/ethical requirements to keep particular records, like donor records. If they are digital then we HAVE to manage and preserve those files)

Again, an inventory can help raise awareness within your own institution in terms of where you are right now and what you will need in the future.

SERI
State Electronic
Records Initiative

Does your institution have an inventory
of your digital content?

LIBRARY OF
CONGRESS

INSTITUTE of
Museum and Library
SERVICES

Does your institution have an inventory of your digital content?

If you answered “Yes” – Fantastic! You have a great head start. Now, do you know where the inventory is stored? When was the last time it was updated? Is it complete – or is it just an inventory of digital content of a particular type, or on a particular server?

If no, do you need to get permission to start an inventory project?

The slide features a light blue and green background with abstract curved lines. The title 'Inventory Considerations' is in blue. A bulleted list is on the left. Logos for SERI, Microsoft Office, OpenOffice.org, Library of Congress, and the Institute of Museum and Library Services are on the right and bottom.

Inventory Considerations

- Content of inventory more important than its style or format
- Use available, familiar software to get started
 - What software or tools do you already have?
 - What free or open source tools might be useful?
- Test it out with a number of people or collections
- Be consistent, comprehensive and concise

LIBRARY OF CONGRESS

SERI
State Electronic
Records Initiative

Microsoft
Office

OpenOffice.org

INSTITUTE of
Museum and Library
SERVICES

The content of an inventory is more important than its style or format. Don't let implementing the software become the focus.

Use software you know and have available.

Stick with a single format; don't change once you've decided on it.

Be consistent, comprehensive, and concise.

Inventory characteristics

- An effective inventory is . . .
 - Scalable: content will be added over time
 - Available: accessible to team, managers, others
 - Usable: simple format to sort, list, etc.
 - Current: updated periodically
 - Electronic: needs to be a dynamic format
 - Documented: an inventory needs to be captured

LIBRARY OF CONGRESS

SERI
State Electronic
Records Initiative

INSTITUTE of
Museum and Library
SERVICES

An effective inventory is ...

Scalable - You will be adding content to it over time

Available to others: This should be a group project within your own institution. One person can manage it, but there is no way one person will know where everything is and what it consists of. This is a tool to ensure you are all starting from the same place and collecting the same information.

Usable – anyone should be able to pick it up and understand it.

Current - This is not a static thing. Make sure you track it when it's updated. This helps keep it a "live" document. This is also REALLY hard.

Electronic – Easier to work with, you don't have legibility issues. It's also easier to report off of – showing change over time.

Documented – Again, easier to keep track of what you have over time, report off of and gives you something to show someone when you would like to request resources.

The slide features a light blue and yellow background with abstract curved lines. The title "Targeting your Inventory" is in blue. A bulleted list of five questions is centered. Logos for SERI, Library of Congress, and the Institute of Museum and Library Services are in the corners.

Targeting your Inventory

- What content are we already preserving?
- What other digital content do we have?
- What content do/will our producers create?
- What content are we required to keep?
- What content do we need to review?

SERI
State Electronic
Records Initiative

LIBRARY OF
CONGRESS

INSTITUTE of
Museum and Library
SERVICES

It's key to make your inventory answer these questions by targeting the inventory at the core mission and functions of your organization, and to also consider the value that preservation adds to the organization.

Targeting your Inventory: Example

- What content are we already preserving? **Wildlife maps from 2007-today**
- What other digital content do we have? **Maps from 2000-2007 on compact discs.**
- What content do/will our producers create? **USGS survey every 3 months**
- What content are we required to keep? **Data for the last 10 years needs to be online.**
- What content do we need to review? **2003-2007 data.**

 LIBRARY OF CONGRESS

 SERI
State Electronic Records Initiative

 INSTITUTE of
Museum and Library
SERVICES

Here's an example from the California Department of Fish and Wildlife - ACE II – which means Areas of Conservation Emphasis. It provides data to help guide and inform conservation priorities in California.

Level of Detail

- You decide appropriate level of detail to capture, based on factors such as:
 - Extent of content to be inventoried
 - Nature and location of content to be inventoried
 - Resources available to complete inventory
 - Timeframe, deadlines for completing inventory

SERI
State Electronic
Records Initiative

LIBRARY OF CONGRESS

**INSTITUTE of
Museum and Library
SERVICES**

You decide what details you need, such as...

Extent - How much is there? Both within your organization that you need to manage and in another organization that you might be getting records from.

This will help you identify digital content that may have made its way into your organization through different points and currently lives in disperse locations. Perhaps some came from a state agency, some came in with a manuscript collection, some came in from a vendor/contractor, or some from a digitization project.

This tool can also be used at the contributor level when you are talking about what they have that should be transferred to you.

Nature and location – This answers the questions ofWhere is it? Can you access it?

Resources - How much money/manpower can you devote to collecting this information?

Timeframe - How much time do you have to do this?

A presentation slide titled "Inventory Considerations" in blue text. The background is a light blue and yellow gradient with abstract curved lines. In the top right corner is the SERI logo (State Electronic Records Initiative). In the bottom left corner is the Library of Congress logo. In the bottom right corner is the Institute of Museum and Library Services logo. The main content is a bulleted list of four questions.

Inventory Considerations

- What do you have?
- What does it consist of?
- Who manages it?
- Where is it?

LIBRARY OF CONGRESS

SERI
State Electronic
Records Initiative

INSTITUTE of
Museum and Library
SERVICES

Work at the collection or series level, not the item level. What is the familiar title for the collection?

Provide a brief description of what is in the collection.

You are collecting information about items that are known and may be in your catalog + items that have come in your door that are waiting to be dealt with + items that are being created (digitization projects) + things you may not even know about yet...

What do you have?

Inventories should include all relevant content categories.

- Institutional records
- Special collections
- Scholarly content
- Research data
- Web content
- Other?

The slide features a central illustration of a man in a blue shirt and dark pants juggling several digital media items: a CD, a cassette tape, a question mark, a smartphone, and a hard drive. The background is a light blue and yellow gradient with abstract curved lines.

SERI
State Electronic
Records Initiative

LIBRARY OF CONGRESS

**INSTITUTE of
Museum and Library
SERVICES**

First identify records in broad groups. You may not have all types of content.

What do you have?

An inventory should identify format types within categories of content, such as:

- Images
 - JPG
- Video
 -
- Audio
 - WAV
- Text
 - PDF
- Maps/geospatial
 -
- Drawings
 -
- Web content
 - HTML
- Structured data
 -

LIBRARY OF CONGRESS

SERI
State Electronic
Records Initiative

INSTITUTE of
Museum and Library
SERVICES

Then identify file formats. The format types will depend on what content you have. Don't worry about formats you don't have (or don't have yet) because your inventory will narrow down your scope of concern.

It's a good idea to note the media type, or what the digital content is stored on, since some media types last longer than others. Digital content on more fragile media might be a higher priority when you get to the selection phase.

What if, for example, the only final copy of a report or document is stored on somebody's flash drive in a drawer at their desk? Not only is the document unavailable to those that might need access to it, but if something happens to the flash drive, it will be lost forever.

This chart is nice because it really illustrates how much shorter the lifespans of digital formats are compared to the physical formats we're more used to, although it still has the lifespan of CDs as being 5-100 years, which is pretty optimistic. Five years is probably closer to the truth.

Software and operating systems: identify operating systems required to access files. Document specific software programs needed to read files.

SERI
State Electronic
Records Initiative

What does it consist of?

- Media format (6 CDs, 1 hard drive)
- Extent = Type + quantity
(600 .pdf, 30 .doc)
- Size (in MB, GB, TB)
<http://www.csgnetwork.com/memconv.html>
- Estimated future growth

LIBRARY OF
CONGRESS

INSTITUTE of
Museum and Library
SERVICES

Count what you have, the number of physical media, how many of a given file format, and file sizes, to obtain a grand total.

File-level Tools

Tools are available to help you determine characteristics of your files

- Results will contribute information needed for the Select stage
- Try to automate the process and make it part of record creation / ingest in the future.
- Check to see if your files have metadata to extract

SERI
State Electronic
Records Initiative

LIBRARY OF CONGRESS

**INSTITUTE of
Museum and Library
SERVICES**

To assist you in the inventory task, you may use tools to help automate the process. You can also wait to use tools until the selection step.

File level tools are free, not too hard, and pay off big when used correctly. Take an unknown file directory and use the file level tools to extract an inventory and get technical metadata and format verification on the files as well.

Tools include:

DROID (which stands for Digital Record and Object Identification). It is a software tool developed by The U.K. National Archives to perform automated batch identification of file formats. If it can identify it, DROID will tell you what versions you have, their age and size, and when they were last changed, as well as help you find duplicates. This is a stand-alone tool.

The File Information Tool Set (FITS) was developed by Harvard and wraps a number of open source tools (including DROID) into a package that can be used to more broadly identify, validate and extract technical metadata for a wide range of file formats.

Identifying your file formats helps you to manage your information more effectively. It helps you to identify risks (and therefore plan mitigating actions). It also helps you to save money, for example by supporting data reduction. On the next slide click 'play' to see a demo of DROID.

Embedded Video

<http://www.nationalarchives.gov.uk/information-management/manage-information/preserving-digital-records/droid/>

To run Droid, first download the files from the website, unzip the package and find the droid.bat file. When you run it, this window will open up. First you want to click the Plus button to create a new window. And then you want to add files to the window, such as these, or you can navigate to a different location. Click ok. So the folder is listed here. Then you want to click the start button and it will analyze what's in that folder. If you click the little Plus by there then you can see the data that results from it—so the file extension, size, last modified, and format information, including versions. This will help you determine what types of files you have.

Who Manages It?

- Department – currently managing the collection/digital content
- Staff – primary person/people responsible
- Creator (Internal or External) – who created the digital content

SERI
State Electronic
Records Initiative

LIBRARY OF CONGRESS

INSTITUTE of Museum and Library SERVICES

Moving on – The content we are trying to wrangle rarely lives in one location with one person. Others know and can provide information about these records:

Your Department – You can call this anything that’s appropriate for you and your institution but it’s who is currently managing the content.

Staff – Who is your contact if you have any questions?

Creator – so that you can go back to them with any issues if you have questions about content or format.

The location of the content should stay current. Documenting where the content is stored will be helpful when the content needs to be moved – such as, be deposited with the archives, or moved to a new server.

As you can see, there are many places digital content can hide! You should make sure to specify the location of digital content in your inventory. Some things you will want to consider:

1. How will you specify whether content is located online (meaning on your computer hard drive or a network server), or offline (meaning stored on some removable piece of media, like a CD or flash drive)?
2. Location in storage system. What is the path on the device where the files can be found?
3. Keep in mind that you will need to update the inventory whenever the content moves. If you get too specific you might spend all your time updating file locations.

Location Considerations

Locations of content are important:

- List primary locations (Network drive location, Storage device, Bob's shelf)
- List locations of all backups/copies (CDs in the storage room, weekly backup tapes)

Remember to update location information as content moves.

SERI
State Electronic
Records Initiative

LIBRARY OF
CONGRESS

INSTITUTE of
Museum and Library
SERVICES

You'll need to strike a balance between being clear enough to find the content you're looking for, without going to extremes.

It is best to work at the collection or series level as opposed to the item level.

Be sure to include locations of backups and copies, and identify them as copies instead of additional new content.

Date Considerations

Inventories should note

- Date of inventory and updates to it
- Date created/received – if relevant / possible
- Dates ranges of content – even approximate

SERI
State Electronic
Records Initiative

LIBRARY OF
CONGRESS

INSTITUTE of
Museum and Library
SERVICES

There are several dates that you will need to keep track of in your inventory:

Date of Inventory – Dating the inventory and noting when it was last updated will help people using it and may ensure that it is updated more regularly. The inventory should stay current with your content as it changes and grows.

Date created and/or received – note how old a file is; since it's harder to migrate and open older files, you may want to prioritize these when you get to the selection process.

Dates covered in content – identify the date ranges of the content, for example, files created between 1998 – 2004.

The date of the files and the dates the content covers may sound similar but are actually very different. A creation date could be much newer than the content date (such as recent digitized images of historic photos). These dates will help in using the inventory and in prioritizing your review of the content.

Show Stoppers

Stop if or when the answer is **NO**:

Content

- Does the content have long term value?
- Does it fit your scope and mission?

Technical

- Is it feasible for you to preserve the content?

Access

- Is it possible to make the content available?
- Are you the only holder of this content?

LIBRARY OF CONGRESS

SERI
State Electronic
Records Initiative

INSTITUTE of
Museum and Library
SERVICES

Even if something fits your desired criteria, it still might **not** be reasonable for you to select it. You can use a decision tree or list of questions to help you decide what's practical to preserve.

You've already considered the **content** in view of your selection criteria. And you should already have answered 'yes' to both of these questions to continue considering the materials you hold.

- does the content have long term value?
- does it fit your scope and mission?

Next you need to consider **Technical** issues:

- is it **feasible** for you to **preserve** the content? [Is it a “**digital time bomb**”?
- Some formats are a challenge to preserve, such as video or time-based media.
- Some may be too damaged to preserve. Do you have the skills and resources (either to undertake the preservation yourself or to outsource)?
- Some types of material may require far more expertise and resources than you have available.

And **Access**.

Even if we're not making it public, how useful is a server full of digital content that is safe, but that we can't access?

We need to ask:

- is it possible to make the content available over time?
- Are you the only holder of this content?

If it is not feasible to preserve the content, and not possible to make it available and usable, then it probably shouldn't be included in your selection –especially if you know you are not the only holder of this digital content.

Analyze Your Results

When the inventory is complete, ask yourselves what digital content . . .

- do we have that we didn't know about?
- should we be keeping that we aren't now?
- will we likely create or acquire in the future?
- are we required to keep?
- do we need to review?

SERI
State Electronic
Records Initiative

LIBRARY OF CONGRESS

**INSTITUTE of
Museum and Library
SERVICES**

The inventory allows you to identify the digital content you are already preserving and you can now ask yourselves:

1. What digital content do we have now? – this includes content you are currently managing, as well as the stuff that is taking up server space that you might not even be aware of. Is what we're doing optimal? What efforts are we already making?
2. Are there gaps in what we are preserving, such as things we should keep that we are inadvertently not, like important electronic correspondence?
3. What areas of our digital content do we know/expect will grow over time? Does your office regularly generate audio files during the course of business? If so, how much can you expect to add in the next few years? Are you responsible for an ongoing or upcoming digitization project? You will need to plan to manage those files as well.
4. Which items are dictated by Retention Schedules? Organizational/government requirements? Are there transfer agreements that state you WILL hold and manage a digital collection? Do you have gaps in what you should be collecting – are there things that you SHOULD have but don't have accounted for on the inventory?
5. Is there material that's been saved not because you wanted it but because it never got deleted? e.g. many draft versions of a document? What digital content can you discard?

Outcome 1: Identify potential digital content you may need to preserve

SERI
State Electronic
Records Initiative

LIBRARY OF
CONGRESS

INSTITUTE of
Museum and Library
SERVICES

Identifying records has several outcomes. It identifies potential digital content you may need to preserve. Planning ahead is always better than reacting in the moment.

Outcome 2: Treat the inventory as a management tool that grows as your program grows

The diagram shows a blue tree with a thick trunk and several branches. The branches are filled with various icons representing digital information, such as a laptop, a smartphone, a globe, a mail icon, a music note, a gear, a document, a camera, a magnifying glass, a person, a house, a network of dots, and a bar chart. The tree is set against a light gray background within a white rectangular frame.

LIBRARY OF CONGRESS

SERI
State Electronic
Records Initiative

INSTITUTE of
Museum and Library
SERVICES

Treat the inventory as a management tool that grows as your program grows. Add to it regularly, so you aren't overwhelmed by a big project every few years.

Outcome 3: Use the inventory as a basis for acquiring content, defining submission agreements, plans

LIBRARY OF CONGRESS

SERI
State Electronic Records Initiative

INSTITUTE of
Museum and Library
SERVICES

Use the inventory as a basis for acquiring content, defining submission agreements, and plans.

Working with an existing tool helps to define what you are looking for and what information you need about that collection when you develop your transfer agreements. It provides your content creators some context and ensures you get the information about the collection that you need in order to manage it.

Outcome 4: Use it as a planning tool – e.g., to prepare staff, training, annual growth

The image depicts a person in a business suit standing on a globe, looking out at a vast, hazy landscape. The globe is covered in various business and planning terms and symbols, including 'Business Plan', 'Concept', 'Risks?', 'Structure', 'Market Analysis', 'Finance', 'Team', 'Global', 'Advantage?', and 'Thought Process'. The background is a soft, hazy blue and white, suggesting a sunrise or sunset. The overall theme is strategic planning and business development.

LIBRARY OF CONGRESS

SERI
State Electronic Records Initiative

INSTITUTE of Museum and Library SERVICES

Use it as a planning tool, to prepare staff, for training, or annual growth. Keep it in good enough shape to share it with those who fund you.

This completes module 1, Identify. If you are using these modules in order, the next one is module 2, Select. For additional resources on electronic records preservation and management, please visit the State Electronic Records Initiative webpage. This link is on your screen.
